

Weight of Evidence (WOE) Approach for Chemicals with Limited Toxicity Data (LTD)

Tiffany Bredfeldt, Jong-Song Lee, Roberta Grant and Ross Jones

TCEQ Toxicology Division

Beyond Science and Decisions Workshop Case Study

Problem Formulation

- The TCEQ is required to derive effects screening levels (ESLs) for all chemicals permitted in the state
- We have formal guidelines detailing the approach to derivation of toxicity factors, including ESLs for chemicals with limited toxicity data
- The TCEQ guidelines discuss potential methods
- These methods are broad and do not offer a detailed description of how different lines of evidence for chemicals with limited toxicity data is weighted

Effects Screening Levels (ESLs)

- Chemical-specific air concentrations set to protect human health and welfare
 - ❖ Short-term ESLs are based on data concerning acute health effects [1-hr intermittent], odor/nuisance potential, and vegetative effects
 - ❖ Long-term ESLs [annual] are based on data concerning chronic non-carcinogenic and/or carcinogenic health effects and vegetative effects

WOE Methods

- Systematic narrative review
- Criteria-based causal inference
- Statistical technique (e.g., meta-analysis)
- Hierarchy of data types
- Mixed approach (epi and tox)

Narrative Review

- Statement of Purpose
- Literature search methods
- Inclusion and exclusion criteria for reviewed studies
- Methods for summarizing evidence
- Methods for interpreting evidence
- Criteria for conclusion
- Recommendation
- Goal: to describe state of the science

Hill Criteria for Causation

- Consistency
- Strength
- Dose-response
- Temporality
- Experimentation
- Specificity
- Biological plausibility
- Coherence
- Analogy

Potential Problems with ESLs for LTD Chemical

- Lack of transparency
 - Need to describe how data was chosen
 - Need to describe how data was interpreted
- Variance in definitions and or applications of data
 - Harmonization of terminology and approaches
- Different weighting systems
 - Harmonize approaches or generate a framework that clearly describes data selection and hierarchy
- Role of scientific or professional judgment
 - Varies from scientist to scientist but needs to be communicated

The Not so Simple Solution...

- Formalized methods reduce subjectivity and variance
- Increase transparency
- Expert judgment will increase as available data decreases
- Communication and clarity are critical

Goals of this Case Study

- To describe the *meaning* of Weight of Evidence (WOE) and *methods* used to evaluate available information and derive ESLs for LTD chemicals
- To generate a scientifically-defensible WOE framework approach that can be used by risk assessors evaluating LTD chemicals

Current Methods for LTD Chemicals

- The TCEQ Guidelines for derivation of Toxicity Factors recommends several methods
 - Route-to-route Extrapolation
 - Relative Toxicity/Relative Potency Approach
 - NOAEL-to-LC₅₀ Ratio (Grant et al., 2007)
 - NOAEL or LOAEL adjusted with a safety factor
 - Threshold of Regulation
 - Read-across tables
 - Quantitative Structure-Activity Relationship

A Framework Approach

- Consider available data
- Identify possible approaches
- More than one option?
- Strengths
- Uncertainties or weaknesses
- WOE Analysis

CAS #
Structure

OPTIONS
Surrogate
Threshold of Regulation

- Use data from characterized chemical
- Use data from chemical w/ shared MOA
- Fast
- Minimal resources

- No chemical-specific data
- Variance in surrogate selection
- Very conservative
- High uncertainty
- Speculative

A Framework Approach

OPTIONS

Surrogate
Route-to-Route
N-to-L Ratio
Relative Potency/Toxicity
Read Across
Threshold of Regulation

WOE

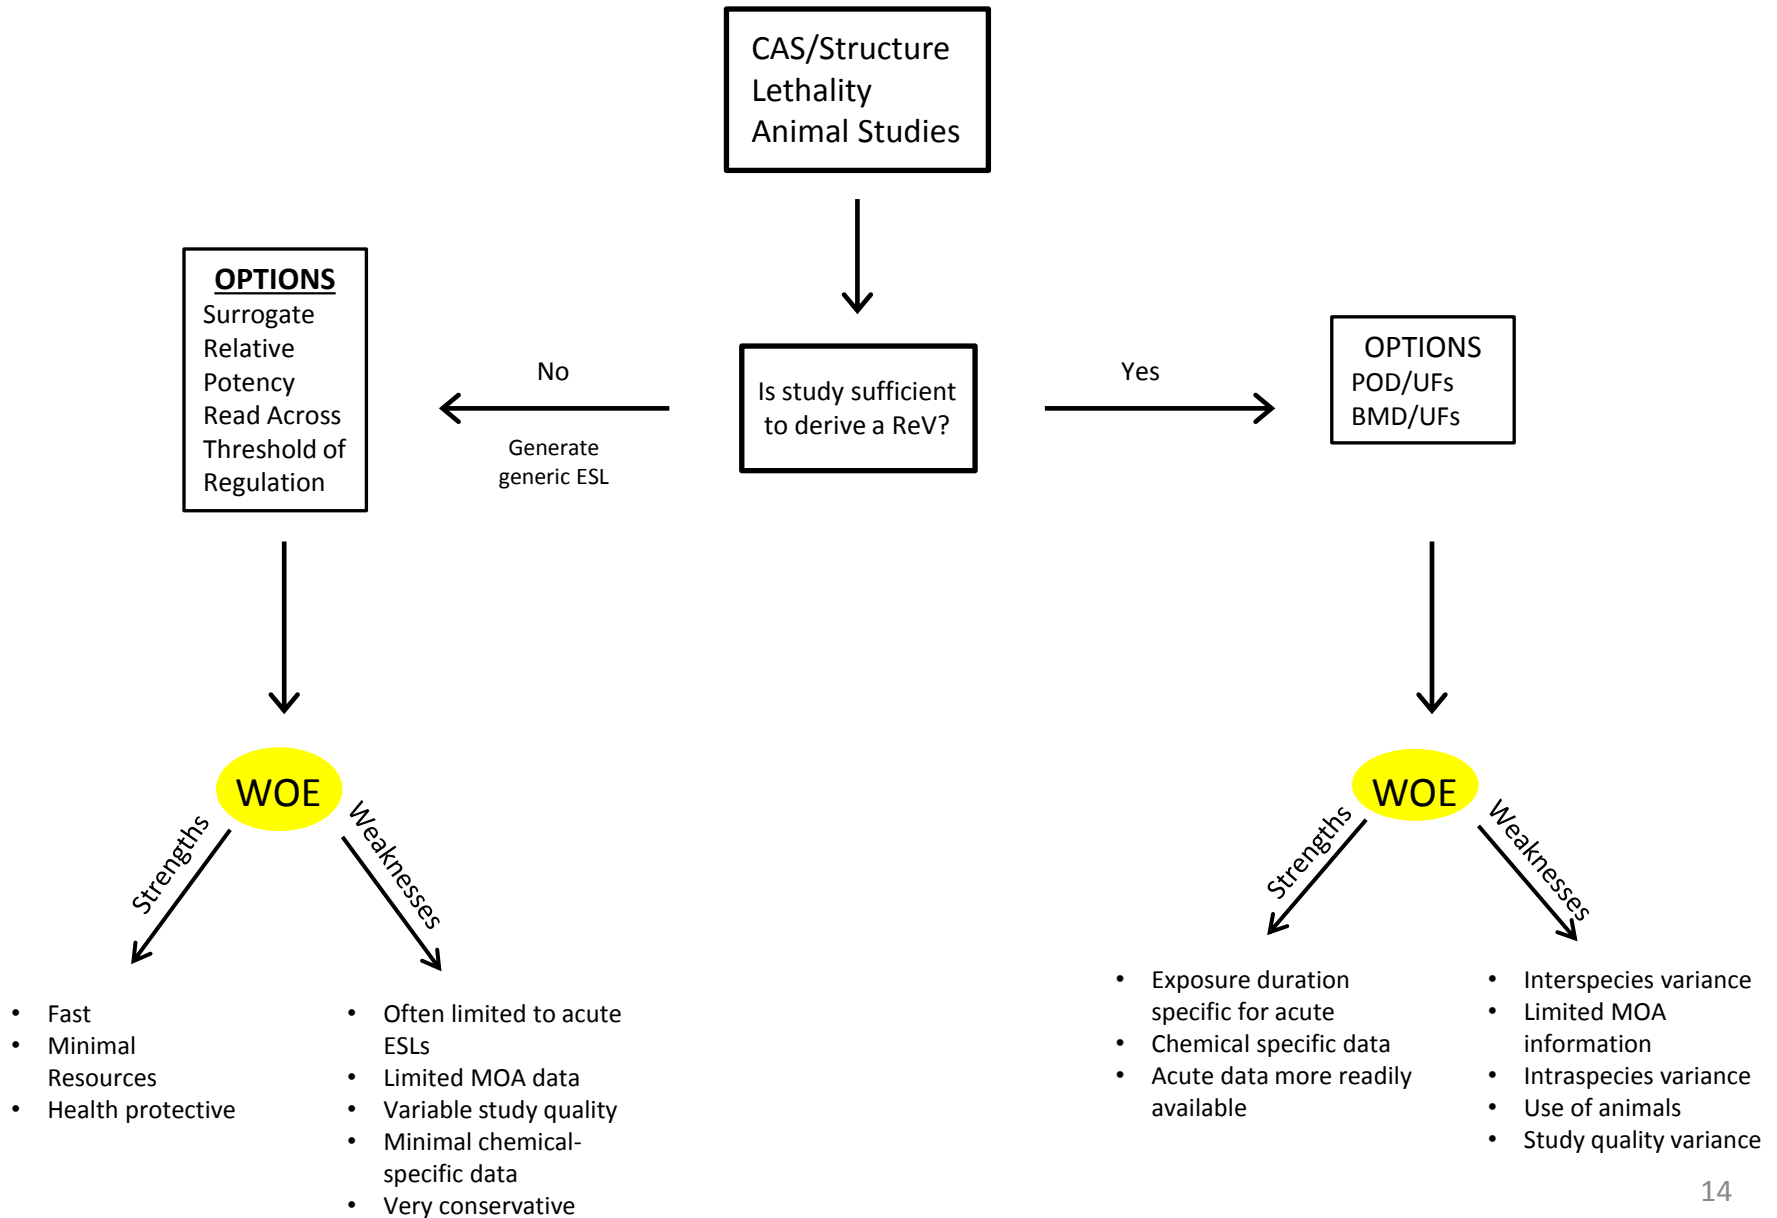

Strengths

Weaknesses

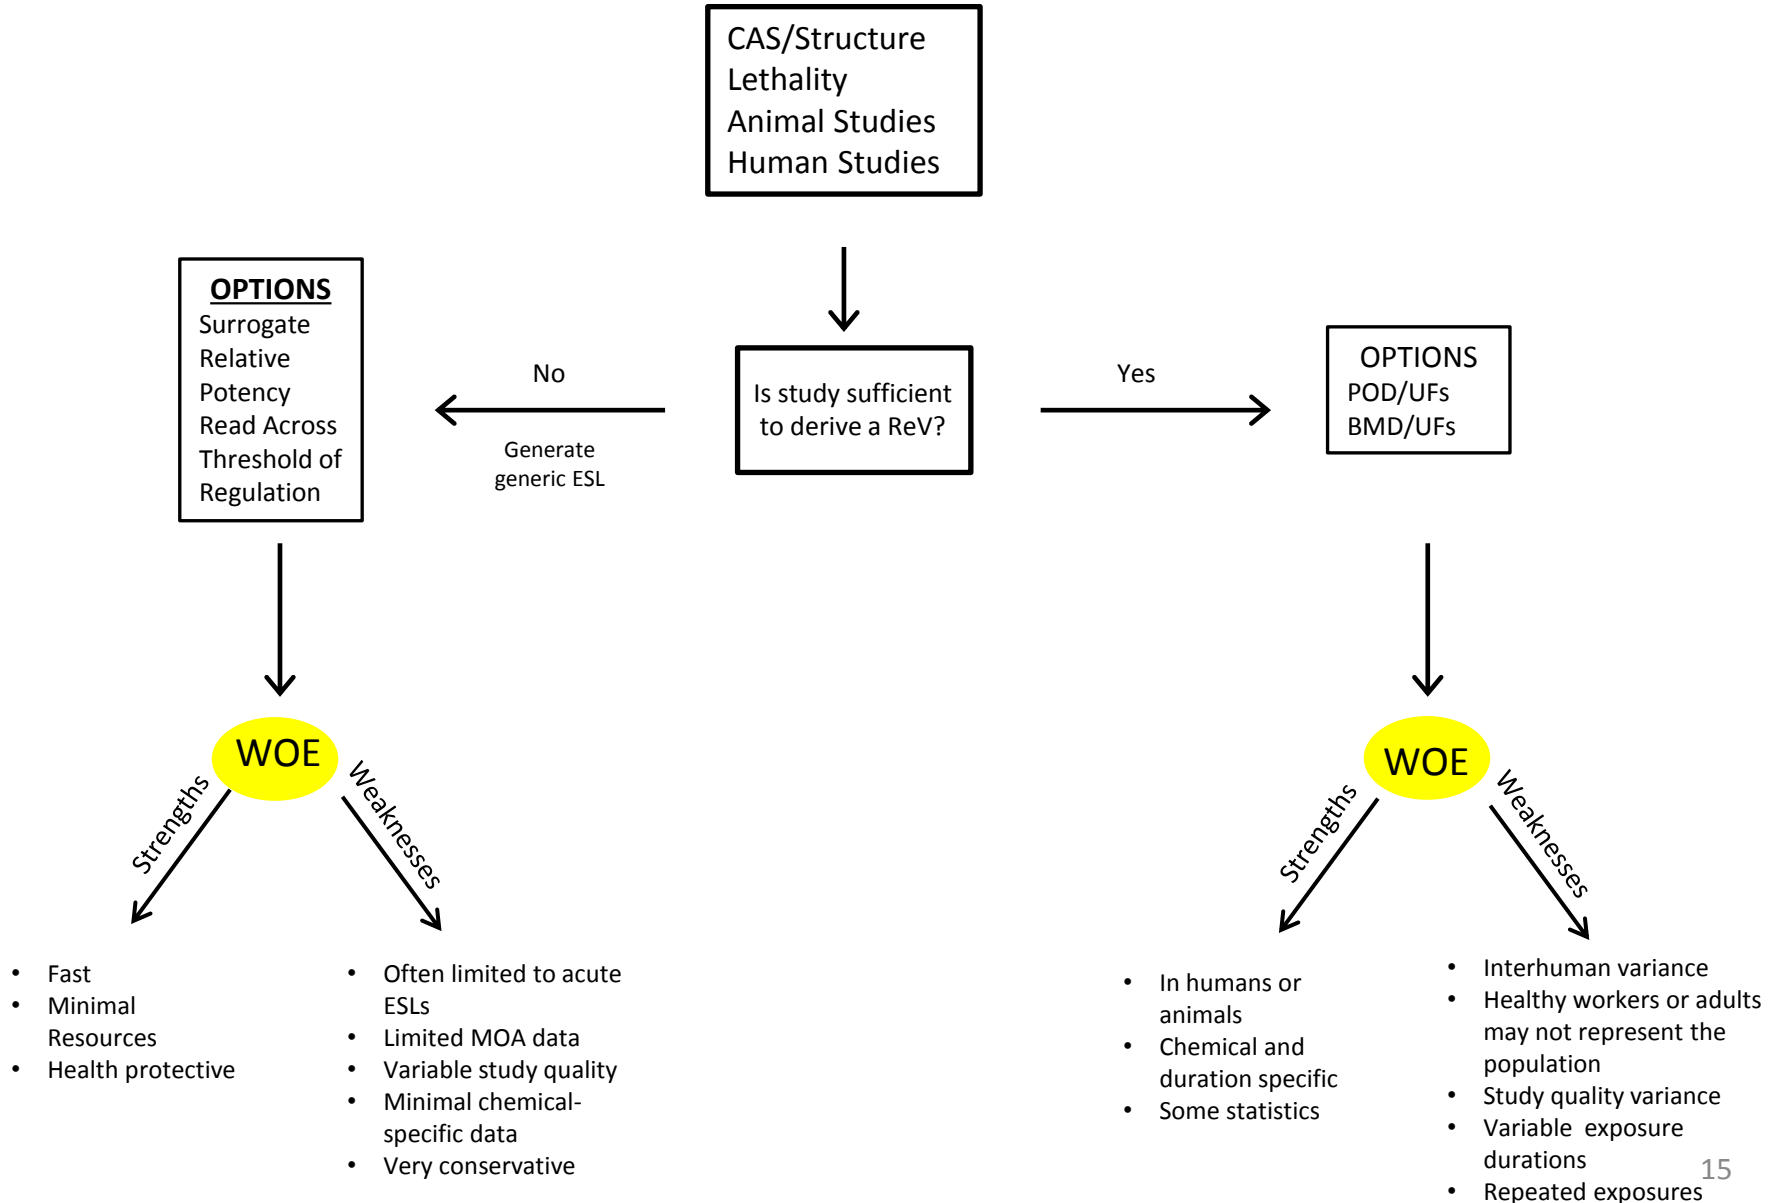

- Fast
- Minimal Resources
- Health protective

- Often limited to acute ESLs
- Limited MOA data
- Variable study quality
- Minimal chemical-specific data
- Very conservative

A Framework Approach

A Framework Approach

Approach	Strengths	Uncertainties	Alternatives
Surrogate	<p>Fast, minimal resources</p> <p>Data-rich chemicals can be surrogates</p> <p>Can apply to both acute and chronic ESLs</p> <p>Can apply to many candidate LTD silanes</p>	<p>Can not apply to all candidate LTD silanes</p> <p>Other hydrolysis products (silanols) not considered</p> <p>Limited chemical specific data</p> <p>No human data</p> <p>May not be protective for certain silane groups</p>	<p>Use of other silanes with chemical specific toxicity data as alternative surrogate</p> <p>N-to-L Ratio</p> <p>Relative Potency/Toxicity</p>
N-to-L Ratio	<p>Fast, minimal resources, health protective</p> <p>Can directly derive ESLs for LTD chemicals when only lethality data are available</p> <p>No need to compare to other chemicals</p> <p>Conservative</p>	<p>Must have data and study quality may vary, be unreliable, or inconsistent</p> <p>No human data</p> <p>Interspecies variance</p> <p>Limited MOA information</p> <p>Can only apply to acute ESL</p> <p>May be too conservative</p>	<p>Relative Potency/Toxicity</p> <p>A default acute ESL of 2 µg/m³ may be used for an acute ESL (called Threshold of Regulation)</p> <p>Category TOC for acute ESLs</p>
Relative Potency/Toxicity	<p>Chemical specific data comparison</p> <p>Index chemical(s) have reliable toxicity factors for comparison</p> <p>Can be used for acute and chronic ESLs</p>	<p>Variance in index chemical(s) selection</p> <p>Study quality variance</p> <p>Interspecies variance</p> <p>No human data</p> <p>Limited MOA information</p> <p>Limited chronic toxicity data</p> <p>Time consuming</p>	<p>Surrogate</p> <p>N-to-L Ratio for acute ESLs</p> <p>A default acute ESL of 2 µg/m³ may be used for an acute ESL</p> <p>Category TOC acute ESLs</p>
Route-to-Route	<p>Fast, minimal resources</p> <p>Apply only when no inhalation lethality data are available</p> <p>Can be used for acute and chronic ESLs</p>	<p>Limited to oral lethality data</p> <p>Can only apply to acute ESL</p> <p>Oral MOA may be irrelevant to inhalation MOA</p> <p>High uncertainty</p> <p>May not be applicable (i.e., POE effects)</p>	<p>A default acute ESL of 2 µg/m³ may be used</p> <p>Category TOC for acute ESLs</p>
Chemical-Specific Data	<p>Chemical-specific</p> <p>Can be used for acute and chronic ESLs</p>	<p>Study quality</p> <p>No human data</p> <p>Interspecies variance</p> <p>Limited MOA information</p>	<p>Surrogate</p> <p>N-to-L Ratio</p> <p>Category TOC for acute ESLs</p>

Summary: A Framework Approach

- The presented framework is applicable to many different scenarios depending on available data
- Identify possible approaches
- Data quality can be considered
- When there is more than one option, several approaches may be investigated
- Strengths
- Uncertainties or weaknesses
- WOE Analysis

Silanes

- Silanes are widely used in industrial applications.
 - Adhesion promoter
 - Sealant and coating
 - Crosslinking agent
 - Water scavengers
 - Coupling agent
 - Fillers

Chlorosilanes Chemistry

Dimethyl chlorosilane	4478 (4281-6327)	$3627 \div 1 = 3627$	1 : 1	0.8 : 1

Surrogate Approach: HCl

Considerations for Surrogate Selection

Physicochemical Properties	Structural	Biological	Chemical Family
Physical state Hydrolytically unstable Reactive Molecular weight Size Log K _{ow}	Functional groups Electronic features Sterics Individual bond energies	MOA-predictions Irritants POE effects Systemic effects Genotoxicity Direct adduction of biological molecules	Generally shared structures Shared physical/chemical properties Known to be particulate

- Chlorosilanes hydrolyze
- They are irritants based on limited human data
- They share:
 1. Structural: hydrolysis produces Cl-
 2. MOA is similar to HCl
 3. Chemical properties are similar

Surrogate Approach: HCl

Chlorinated Silanes	Acute ESLs	Chronic ESLs
HCl	130 ppb	5.4 ppb
Monochlorinated	130 ppb	5.4 ppb
Dichlorinated	65 ppb	2.7 ppb
Trichlorinated	43 ppb	1.8 ppb
Tetrachlorinated	33 ppb	1.4 ppb

N-to-L Ratio Approach

Chemical	1-hr LC50 (ppm)	4-hr LC50 (ppm)	Acute ESL (ppb)
HCl	3627	907	75
Monochlorinated	4368	1092	91
Dichlorinated	1966	491	41
Trichlorinated	1396	349	29
Tetrachlorinated	1312	328	27

- N-to-L Ratio Approach previously discussed in
 1. Grant et al., 2007
 2. Previous case study
- Duration adjustment of LC50 to 4-hr using Haber's Rule
- Multiply by 8.3×10^{-5}
- Conservative – value lower than HCl ESL

Relative Potency Approach

$$\text{Relative Potency} = \frac{\text{Relevant Endpoint}_{\text{LTD Chemical}}}{\text{Relevant Endpoint}_{\text{Index Chemical}}}$$

Chemical	LC50 ratio	Acute ESL (ppb)	Chronic ESL (ppb)
HCl	1	130	5.4
Monochlorinated	1.2	160	6.5
Dichlorinated	0.54	70	2.9
Trichlorinated	0.38	49	2.0
Tetrachlorinated	0.36	46	1.9

WOE Analysis: Surrogate Approach

Uncertainties

Strengths

Summary & Conclusions

- Three separate approaches resulted in very similar ESLs
- MOA of HCl is similar to that of chlorosilanes
- Surrogate approach for ESLs
 - Conservative
 - MOA appropriate (key studies for acute and chronic exposure)
 - ESLs have been reviewed and subjected to public comment

Methoxy Silanes

- Hydrolyze at different rates
- Produces methanol and associated silanols

Available Data

Data	Mono-methoxy	Di-methoxy	Tri-methoxy	Tetra-methoxy
Human	--	--	--	--
Animal Lethal	--	<ul style="list-style-type: none"> - Rodent 4-h LC50 - Not exact number observed 	<ul style="list-style-type: none"> - Rodent - MTMS - TMS 	<ul style="list-style-type: none"> - Rodent - TetMS
Animal Non-Lethal	--	<ul style="list-style-type: none"> - Oral - No inhalation 	- 90-day study inhalation	- 28-day study inhalation
Analogue or Category	<ul style="list-style-type: none"> - Rapid hydrolysis yields MeOH - MeOH is a good analogue - MeOH is data-rich and has a DSD 	<ul style="list-style-type: none"> - Rapid hydrolysis to MeOH - Two molar equivalents of MeOH 	<ul style="list-style-type: none"> - Rapid hydrolysis to MeOH - Three molar equivalents of MeOH 	<ul style="list-style-type: none"> - Rapid hydrolysis to MeOH - Four molar equivalents of MeOH

Surrogate Approach

Chemical	Acute ESL	Chronic ESL
Methanol	3000 ppb	1600 ppb
2 Molar Equivalents Methanol	1500 ppb	800 ppb
3 Molar Equivalents Methanol	1000 ppb	530 ppb
4 Molar Equivalents Methanol	750 ppb	400 ppb

- Methoxysilanes hydrolyze to produce methanol and silanols
- They are irritants based on limited animal data, which is similar to methanol
- Methanol has an ESL that has been derived and subjected to review and public comment

N-to-L Ratio Approach

Chemical	4-hr LC50 (ppm)	Acute ESL (ppb)
Methanol (MeOH)	64000	5300
Dimethoxydimethylsilane (DMDMS)	> 4300	360
Trimethoxymethylsilane (MTMS)	> 8700	720
Trimethoxysilane (TMS)	60	5
Tetramethoxysilane (TetMS)	63	5.2

- Methoxysilanes appear to be more toxic than methanol
- The toxicity alone does not appear to be strictly related to molecular equivalents of methanol present
- Silanols are generally thought to be less toxic
- MOA is unclear
 1. Lung lesions
 2. Nephrotoxicity (calculi and dilation)

Toxicity of Methoxysilanes

- Methanol is less toxic than the methoxysilanes and likely a poor surrogate
- Animal studies are available for derivation of chemical-specific values for MTMS, TetMS, and TMS
- It is possible to surrogate methoxysilanes with no chemical-specific data to methoxysilanes with some data

Chemical-Specific Data

Chemical	Study	POD (ppm)	Acute ESL	Chronic ESL	Notes
Monomethoxysilane	N/A	N/A	N/A	N/A	No studies available
Dimethoxysilane	N/A	N/A	N/A	N/A	No studies available
Methyltrimethoxysilane (MTMS)	90-day rat	100	N/A	330 $\mu\text{g}/\text{m}^3$ (60 ppb)	90-day study not appropriate for acute ESL calculation
Trimethoxysilane (TMS)	90-day rat	0.5	N/A	Not Used	Study results inconsistent and possibly unreliable ESL not derived from this study
Tetramethoxysilane (TetMS)	28-day rat	10	360 $\mu\text{g}/\text{m}^3$ (60 ppb)	36 $\mu\text{g}/\text{m}^3$ (6 ppb)	Study could be used for both chronic and acute ESL derivation

Relative Potency Approach

$$\text{Relative Potency} = \frac{\text{Relevant Endpoint (4hr LC50)}_{\text{LTD methoxysilane}}}{\text{Relevant Endpoint (4hr LC50)}_{\text{Index Chemical (methanol)}}$$

Chemical	4-hr LC50 (ppm)	Relative Potency Ratio	Acute ESL (ppb)	Chronic ESL (ppb)
Methanol (MeOH)	64000	1	3000	1600
Dimethoxydimethylsilane (DMDMS)	> 4300	0.067	200	100
Methyltrimethoxysilane (MTMS)	> 8700	0.14	420	220
Trimethoxysilane (TMS)	60	0.0009	2.7	1.4
Tetramethoxysilane (TetMS)	63	0.001	3	1.6

MeOH ESL x Relative Potency = ESL

Methoxysilanes ESLs

Chemical	Acute ESL (ppb)	Basis	Chronic ESL (ppb)	Basis
Methanol (MeOH)	3000	MeOH DSD	1600	MeOH DSD
Monomethoxysilane (MMS)	200	Surrogate (DMDMS)	100	Surrogate (DMDMS)
Dimethoxydimethylsilane (DMDMS)	200	Relative Potency (MeOH)	100	Relative Potency (MeOH)
Methyltrimethoxysilane (MTMS)	420	Relative Potency (MeOH)	60	Chemical-Specific
Trimethoxysilane (TMS)	60	Surrogate (TetMS)	6	Surrogate (TetMS)
Tetramethoxysilane (TetMS)	60	Chemical-Specific	6	Chemical--Specific

Data Priorities

- Interpretations of limited data should be considered in the context of the entire body of data
- When a ReV cannot be derived, generic approaches should be considered
- Generic approaches vary in their utility and applicability
- Sometimes a suitable surrogate cannot be identified
- Index chemicals do not necessarily need to be more or less toxic- just more data rich

WOE Analysis: Surrogate Approach

Uncertainties

Strengths

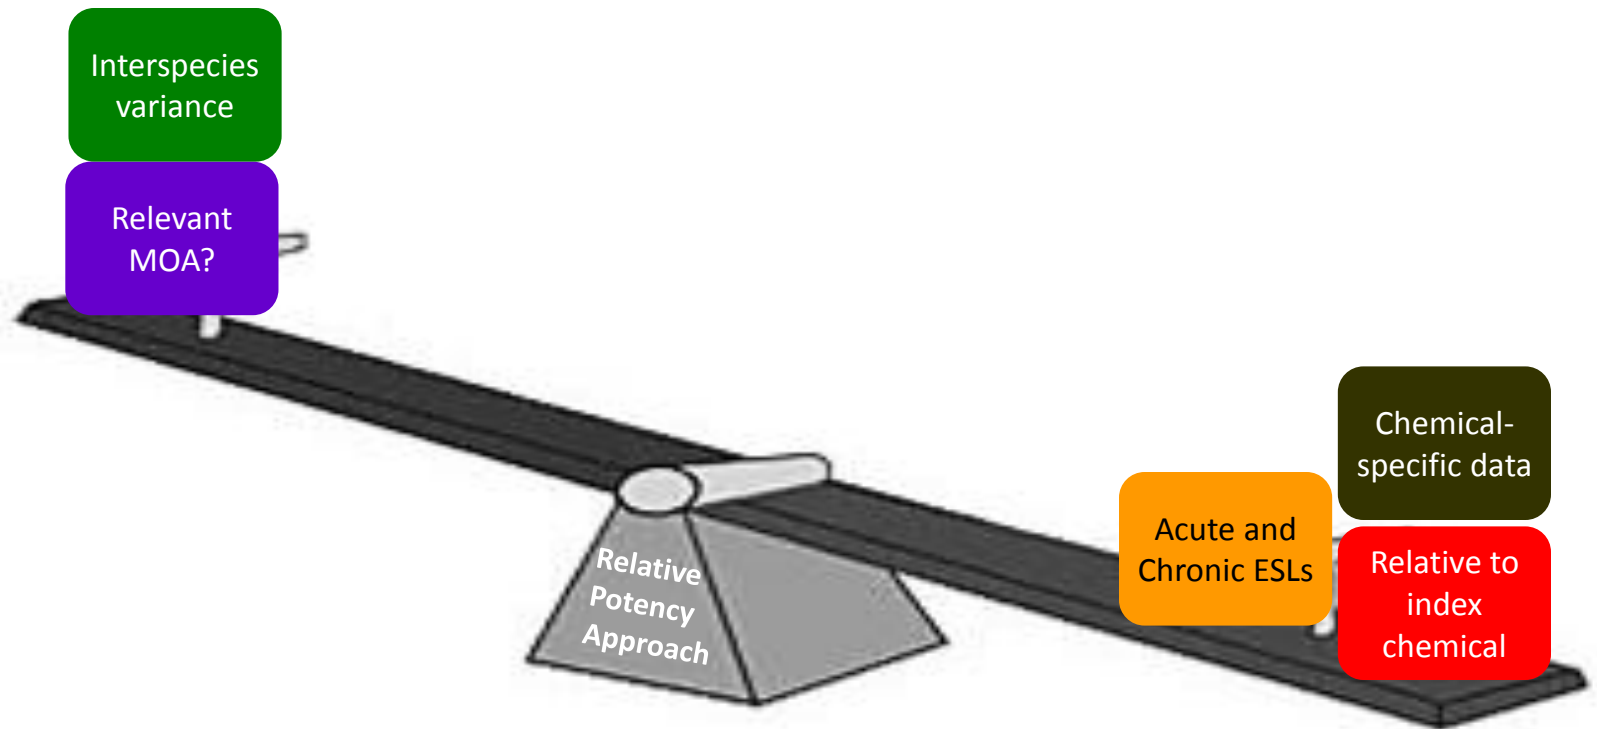

WOE Analysis: N-to L Ratio Approach

Uncertainties

WOE Analysis: Relative Potency Approach

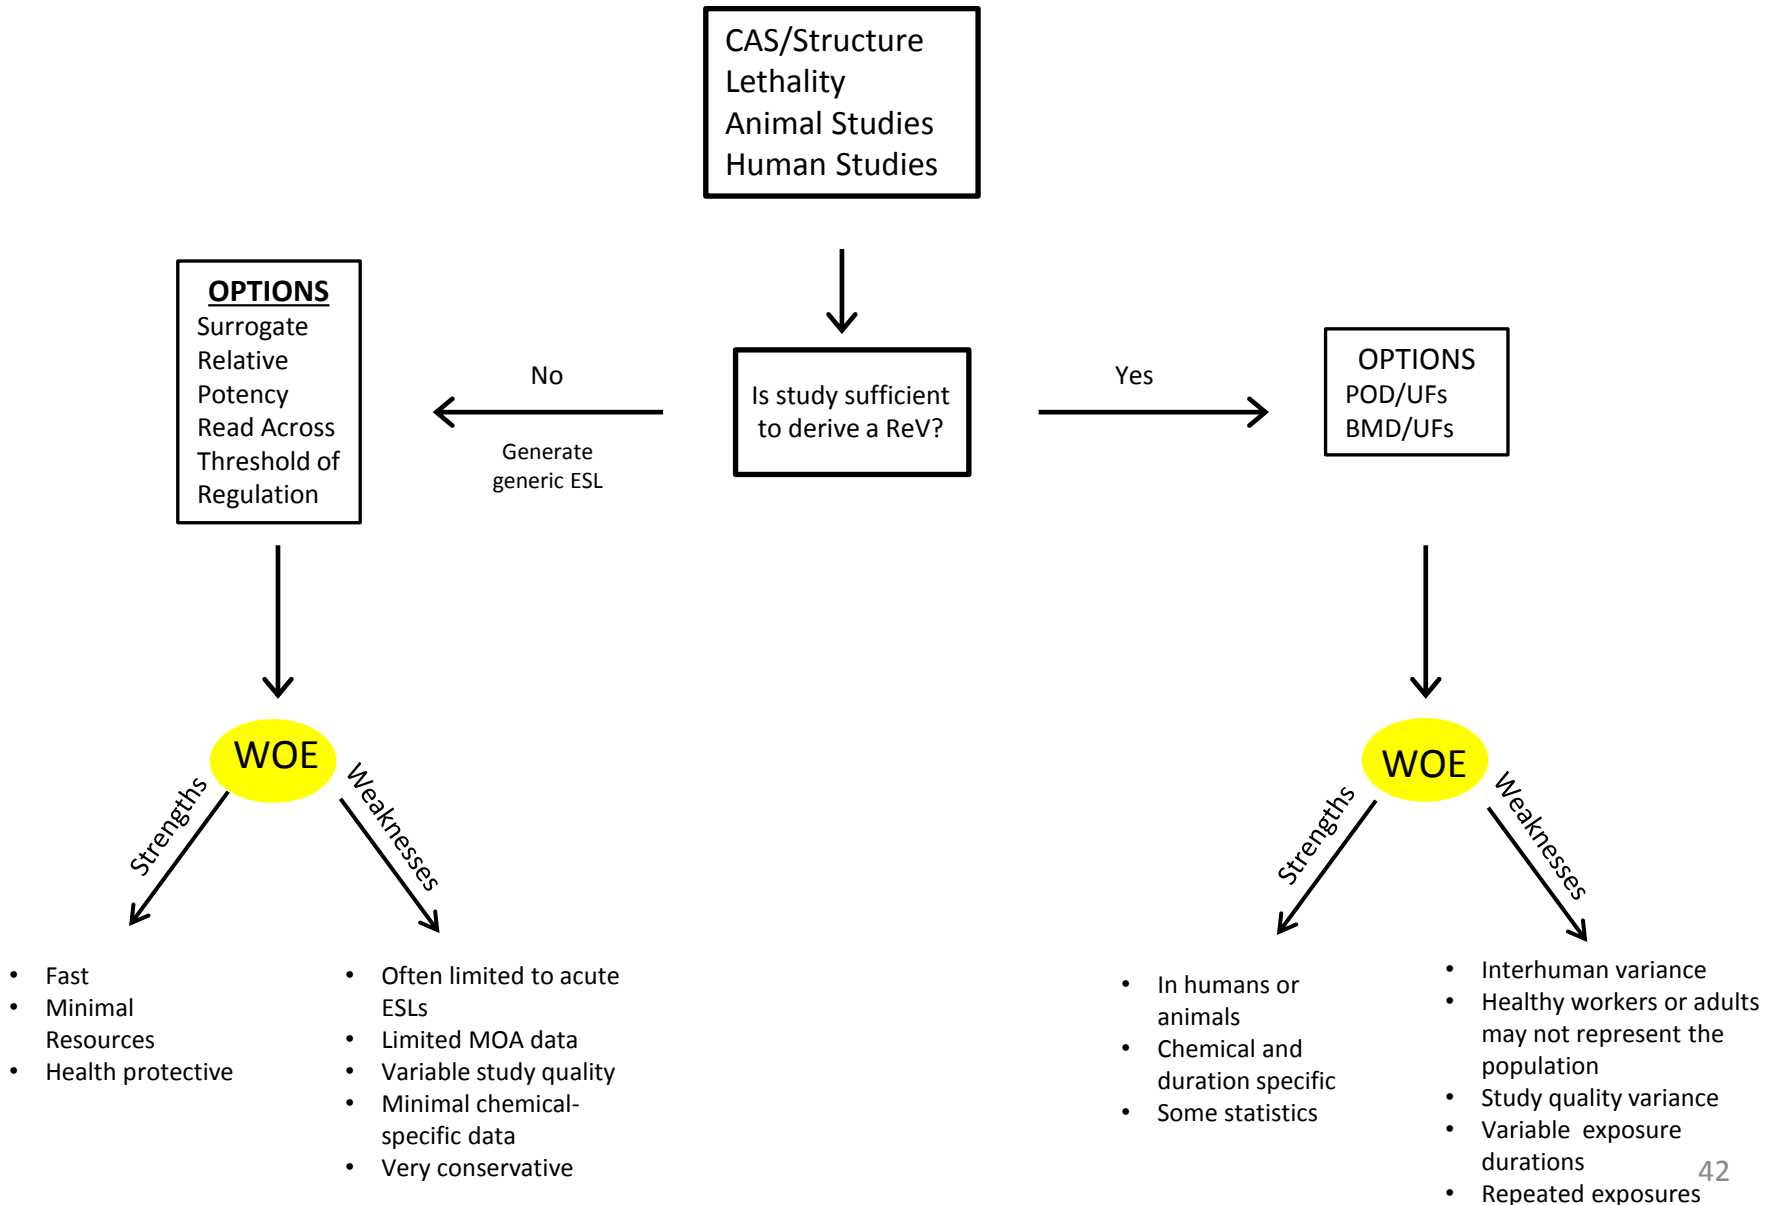

Uncertainties

Strengths

Summary and Conclusions

- Evaluation of the available evidence indicates MeOH as a surrogate may not be protective
- MeOH is a well-characterized chemical that may be used as an index chemical
- Chemical-specific data was limited to a few animal studies that could be applied to ESL generation (i.e., used for a ReV)
- A combination of surrogate, relative-potency, and chemical-specific approaches were used to derive ESLs for methoxysilanes

Data As A Spectrum of Information

The Data Spectrum

Methyltrimethoxysilane (MTMS) ESL

- No acute studies for ESL derivation
- 90-day subchronic study 6 hr/day, 5 day/week
- Concentrations: 0.14, 0.56, 2.2, and 8.9 mg/L
- NOAEL 0.56 mg/L (100 ppm)
- LOAEL 2.2 mg/L (400 ppm)
- Increased urinary bladder calculi and kidney dilation
- $POD_{HEC} = 17.8$ ppm (intermittent to continuous, HEC)
- Chronic ReV = $POD_{HEC} / (UF_H \times UF_A \times UF_{Sub} \times UF_D)$
 - = 17.8 ppm / (10 x 3 x 1 x 3)
 - = 0.198 ppm
 - = 200 ppb or 1,100 $\mu\text{g}/\text{m}^3$
- ESL = ReV x 0.3 = **60 ppb (330 $\mu\text{g}/\text{m}^3$)**

Tetramethoxysilane (TetMS)

- 28-day study available to derive acute and chronic ESLs
- Rats exposed 6 hr/day, 5 days/week for 28-days
- NOAEL of 10 ppm
- Acute ReV =

$$\begin{aligned} & \text{POD}_{\text{HEC}} / (\text{UF}_H \times \text{UF}_A \times \text{UF}_D) \\ &= 18.2 \text{ ppm} / (10 \times 3 \times 3) \\ &= 0.202 \text{ ppm} \\ &= 200 \text{ ppb or } 1,200 \text{ } \mu\text{g}/\text{m}^3 \end{aligned}$$

- ESL 60 ppb (360 $\mu\text{g}/\text{m}^3$)

Tetramethoxysilane (TetMS)

- Rats exposed 6 hr/day, 5 days/week for 28-days
- NOAEL of 10 ppm
- Chronic ReV

$$= \text{POD}_{\text{HEC}} / (\text{UF}_H \times \text{UF}_A \times \text{UF}_{\text{Sub}} \times \text{UF}_D)$$

$$= 1.79 \text{ ppm} / (10 \times 3 \times 1 \times 3)$$

$$= 0.02 \text{ ppm}$$

$$= 20 \text{ ppb or } 120 \mu\text{g}/\text{m}^3$$

- Chronic ESL = 6 ppb ($36 \mu\text{g}/\text{m}^3$)
- ReV multiplied by a HQ of 0.3

Trimethoxymethylsilane (TMS) ESL

4-hr LC ₅₀	9-day NOAEL	9-day LOAEL	4-week NOAEL	90-day NOAEL
60 ppm	0.2 ppm	1 ppm	0.5 ppm	0.5 ppm (free-standing)

- The 9-day NOAEL is lower than the 90-day NOAEL
- The variance in NOAELs increases uncertainty in which study would be appropriate for ESL derivation.
- If the 9-day NOAEL is less than the 90-day NOAEL, it is unlikely that the 90-day study would be considered reliable for ESL derivation.
- The 4-hr LC₅₀ (60 ppm) for TMS, however, is almost the same as the 4-hr LC₅₀ (63 ppm) for tetramethoxysilane. Thus, the long- and short-term ESLs for tetramethoxysilane are used as surrogate for TMS.
